

WEB SERVER (APACHE)

TASKS

1.Install Apache web server on your Linux system and verify the installation by accessing the default Apache welcome page from your browser using localhost.

Install Apache and Verify

Step 1: Install Apache

dnf install httpd -y

```
[root@localhost ~]# dnf install httpd -y
Last metadata expiration check: 0:43:22 ago on Wed 22 Jul 2026 06:19:29 PM IST.
Package httpd-2.4.62-14.el9.x86_64 is already installed.
Dependencies resolved.
Nothing to do.
Complete!
[root@localhost ~]#
```

Step 2:
Enable

Apache

systemctl enable httpd

Step 3: Start Apache

systemctl start httpd

Step 4: Check Status

systemctl status httpd

```

[root@localhost ~]# systemctl status httpd
● httpd.service - The Apache HTTP Server
   Loaded: loaded (/usr/lib/systemd/system/httpd.service; enabled; preset: disabled)
   Drop-In: /usr/lib/systemd/system/httpd.service.d
            └─php-fpm.conf
   Active: active (running) since Wed 2026-07-22 14:54:42 IST; 4h 8min ago
     Docs: man:httpd.service(8)
  Main PID: 1082 (httpd)
    Status: "Total requests: 24; Idle/Busy workers 100/0;Requests/sec: 0.00161; Bytes served/sec: 0 B/sec"
    Tasks: 230 (limit: 4273)
   Memory: 9.4M (peak: 19.3M)
      CPU: 15.702s
   CGroup: /system.slice/httpd.service
            └─1082 /usr/sbin/httpd -DFOREGROUND
              1179 /usr/sbin/httpd -DFOREGROUND
              1190 /usr/sbin/httpd -DFOREGROUND
              1196 /usr/sbin/httpd -DFOREGROUND
              1212 /usr/sbin/httpd -DFOREGROUND
              6079 /usr/sbin/httpd -DFOREGROUND

Jul 22 14:54:41 localhost.localdomain systemd[1]: Starting The Apache HTTP Server...
Jul 22 14:54:42 localhost.localdomain httpd[1082]: AH00558: httpd: Could not reliably determine the server's
Jul 22 14:54:42 localhost.localdomain systemd[1]: Started The Apache HTTP Server.
Jul 22 14:54:42 localhost.localdomain httpd[1082]: Server configured, listening on: port 80
lines 1-23/23 (END)

```

Step 5: Allow HTTP in Firewall

`firewall-cmd --permanent --add-service=http`

Reload:

`firewall-cmd --reload`

Verify:

`firewall-cmd --list-services`

```

[root@localhost ~]# firewall-cmd --list-services
cockpit dhcpv6-client ftp http samba ssh
[root@localhost ~]#

```

Step 6: Test in Browser

Find IP

`hostname -I`

Example

192.168.231.128

Open browser

`http://localhost`

or

http://192.168.231.128

2. Change the default Apache web server homepage by editing the index.html file in /var/www/html to display your name and favorite IPL team.

Change Default Homepage

Step 1: Go to Web Root

```
cd /var/www/html
```

Step 2: Edit index.html

```
vi index.html
```

Press

i

Paste

```
<html>
```

```
<head>
```

```
<title>My Website</title>
```

```
</head>
```

```
<body>
```

```
<h1>Welcome to My Website</h1>
```

```
<h2>Name : Diya Tandel</h2>
```

```
<h2>Favorite IPL Team : Chennai Super Kings (CSK)</h2>
```

</body>

</html>

Save

Esc

:wq

Step 3: Test

Browser

http://localhost

3. Configure a custom virtual host in Apache for a new domain called myzomatoclone.local that serves files from /var/www/myzomatoclone and test it by updating your /etc/hosts file.

Create Virtual Host

Step 1: Create Directory

mkdir -p /var/www/myzomatoclone

Step 2: Create Webpage

vi /var/www/myzomatoclone/index.html

Paste

```
<html>
```

```
<body>
```

```
<h1>Welcome to My Zomato Clone</h1>
```

```
</body>
```

```
</html>
```

Save

Esc

:wq

Create Virtual Host File

```
vi /etc/httpd/conf.d/myzomatoclone.conf
```

Paste

```
<VirtualHost *:80>
```

```
ServerName myzomatoclone.local
```

```
DocumentRoot /var/www/myzomatoclone
```

```
<Directory "/var/www/myzomatoclone">
```

```
AllowOverride All
```

```
Require all granted
```

```
</Directory>
```

```
</VirtualHost>
```

Save

Esc

:wq

Step 4: Restart Apache

`systemctl restart httpd`

Step 5: Edit Hosts File

`vi /etc/hosts`

Add

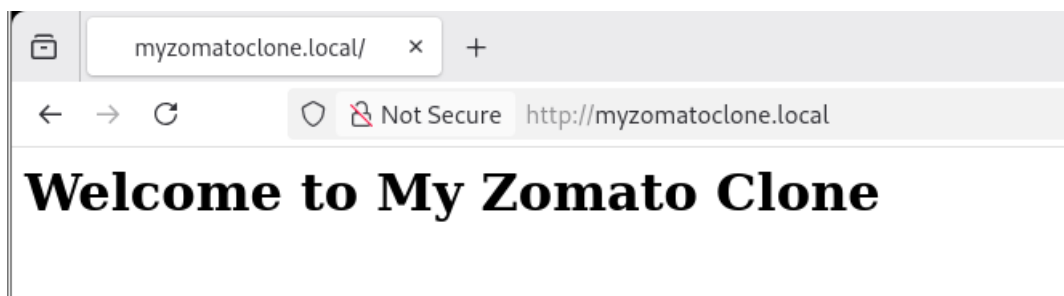

`127.0.0.1 myzomatoclone.local`

Save

Step 6: Test

Browser

`http://myzomatoclone.local`

**4.Enable and test the Apache mod_rewrite module by creating a rule that rewrites requests from /foodie to /index.html, then verify it works in your browser.

Hint: Use the a2enmod command and edit the .htaccess file in your web root.**

Step 1: Edit Apache Configuration

`vi /etc/httpd/conf/httpd.conf`

Find

`<Directory "/var/www/html">`

Change

`AllowOverride None`

to

`AllowOverride All`

Save

Step 2: Create .htaccess

```
vi /var/www/html/.htaccess
```

Paste

```
RewriteEngine On
```

```
RewriteRule ^menu$ index.html [L]
```

Save

Step 3: Restart Apache

```
systemctl restart httpd
```

Step 4: Test

```
http://192.168.231.128/menu
```
